

Immunome Raises \$5 Million Series A Financing to Advance Novel Cancer Immunotherapies

\$5 million funded to advance Immunome’s native human cancer antibody platform

April 20, 2016, Philadelphia, PA - Immunome, Inc., a biotechnology company focused on developing transformative immunotherapies to treat cancer, today announced it has raised \$5 million in Series A Preferred Stock financing. The company anticipates using the proceeds to fund further development of Immunome’s growing pipeline of cancer therapeutic antibodies. The financing included investments from new and existing Immunome investors.

Jane Hollingsworth, Immunome CEO, said, “We thank all of our investors for their confidence and continued support of the development of our technology and pipeline of novel cancer immunotherapy candidates. Our exceptionally productive discovery engine identifies native antibodies and their target antigens raised during a cancer patient’s humoral response. We believe that Immunome is poised to meet the demand for less toxic, novel and highly selective cancer antibodies for the next-generation of immuno-oncology therapies, a market expected to grow to \$35 billion by 2025.”

Scott Dessain, MD, PhD, Immunome co-founder and Chief Scientific Officer, commented, “Immunome has the potential to identify novel antigen antibody pairs from all cancer types and patient subsets, including those that have responded to checkpoint inhibitors. We anticipate identifying multiple therapeutic candidates for T-cell activating and ADC therapies.”

Broadband Capital Management acted as exclusive placement agent for the financing.

About Immunome

Immunome is a biotechnology company with a unique and powerful immunotherapy discovery engine. Immunome's proprietary RealMAB™ technology enables the simultaneous discovery of novel antigens and the cognate native human antibodies that target those antigens. RealMAB, originally developed at Massachusetts Institute of Technology's Whitehead Institute, utilizes the human immune system response to circumvent the weaknesses, complications and inefficiencies of non-human approaches. After identification, Immunome employs its proprietary screening technology to screen for functional and specific cancer activity of these antigen antibody pairs.
